Motivations Simulation BUT also... Tutorial Conclusion

## Motivation: from theory to detectors...

## From theory to detectors...

Knowing if theoretical predictions will be visible and measurable in a high energy experiment is complex and requires several steps:

X. Rouby S. Ovyn

Motivations Simulation BUT also... Tutorial

Conclusion

**1°** Development of a new model

**2°** Implementation and generation of hard interaction

- MadGraph/MadEvent (MG/ME)
- CalcHep

Hard Hard interaction Hadronisation, parton showers

**3°** Simulation of hadronisation and parton showers

- Pythia
- Herwig

return yoke

muon chambers

#### 17/09/2009

Detector characteristics

22m Diameter: 15m Weight: 14'500t

Width:

## Complexity of HE detectors...

- Complexity of the related subdetectors

- tracker

- electromagnetic and hadronic calorimeters
- muon chambers

- Requires the use of complex softwares to simulate

- detailed energy deposition from ionization, showering
- secondary interactions
  - detector inefficiencies
  - multiple scattering

Such a simulation is very complex and a large CPU per event

Phenomenological studies may require only <u>fast</u> but <u>realistic</u> estimates of detector response

## Fast simulation utility

# Delphes

X. Rouby S. Ovyn

**Motivations** 

Simulation

BUT also...

Conclusion

**Tutorial** 

#### Delphes provides:

- Realistic simulation taking into account subdetector extensions, types, segmentations and resolutions

- A tracker in a solenoidal magnetic field
- Calorimeters with electromagnetic and hadronic sections
- Muon system

- Trigger emulation
- An event display

**Delphes** allows easy connection between theoretical and experimental (*distant*) worlds

The code is also independent from any collaboration

7

Tracker

**Calorimeter** 

Motivations Simulation BUT also... Tutorial Conclusion C++ implementation of the simulation

## C++/ROOT implementation

X. Rouby S. Ovyn

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

First step of *Delphes*: conversion of input events into a ROOT tree readable by the rest of the code

Result of the conversion stored in a GEN tree

Allow easy checks between various generators

./Delphes inputlist.list OutputRootFileName.root data/DetectorCard.dat data/TriggerCard.dat

- Input events : *Delphes* is interfaced to standard file formats

- StdHEP
- ROOT files obtained with h2root (hbook)
- Les Houches Event Format
- HepMC

Compatible with - MG/ME, Pythia, Herwig,...

#### Interface:

**EVENTGENERATOR** 

Input convertor

Input list

**Event Data** 

The input file list contains the location of the input files with one file per line!

17/09/2009

## Delphes flow

Output file format: *Delphes* yields realistic observables for all reconstructed high level objects in two formats:

1°) Analysis tree in ROOT files, using ExRootAnalysis, P. Demin

- GEN tree (Monte Carlo level information)
- Analysis tree (detector level information)
- Trigger tree (trigger acceptance)

2°) LHCO

#### <u>Column format</u>

# typ eta phi pt jmass ntrk btag had/em dummy dummy

http://v1.jthaler.net/olympicswiki/doku.php

Typ: 0 = photon, 1 = electron, 2 = muon, 3 = tau-jet, 4 = jet, 6 = MET

Ntrk: number of tracks associated with the object. For of a lepton, this number is multiplied by the charge of the lepton.

For muons: The integer part is the identity of the jet that is closest ot this  $\mu$  in  $\Delta R$ 

had/em: ratio of the hadronic versus electromagnetic energy deposited in the calorimeter cells associated with the object; it is typically > 1 for a jet and << 1 for an electron or  $\gamma$ .

For muons: the format is xxx.yy. The 'xxx' is ptiso, the summed  $p_{\tau}$  in a R=0.4 cone (excluding the μ). The 'yy' is etrat, is the ratio of the transverse energy in a 3×3 grid surrounding the μ to the  $p_{\tau}$  of the muon.

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

## Low objects, detector level information

<u>Smearing:</u> Response of each subdetector parametrised as a function of the energy:

With different response to

- electromagnetic objects
- hadrons

Muons: smearing on the  $p_{\tau}$ 

Parameters controllable using the input datacard

Schematic view of the **Delphes** detector

Detector extension in pseudorapidity

- tracker coverage
- central calorimeter coverage
- forward calorimeter coverage
- muon chambers coverage

S, N and C term of the ECAL, HCAL, FCAL

For all charged particles in the tracking coverage, considering « energy flow »

The tracker is embedded in a magnetic B field

Low level objects : Tracks

X. Rouby S. Ovyn

**Motivations** Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... **Tutorial** Conclusion

17/09/2009

Position of charged particles is modified

- The values of the length and radius of the tracker are important parameters

Impact of the  $\eta$  modification important when the  $p_{\!\scriptscriptstyle \rm T}$  of the particle is too small to reach the central calorimeters

The inner and outer value of the tracks are stored in the Tracks branch of the **Delphes** ROOT file

Eta, Phi, EtaOuter, PhiOuter

<u>II The particle energies are smeared according to the resolution of</u> the calorimeter subdetector they reach !!

#### Simulation of the central solenoidal magnetic field

- homogeneous

 $Bx = By = 0 \implies Exact calculation of the transport of a charged particle$ 

X. Rouby S. Ovyn

**Motivations** Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also...

**Tutorial** 

Conclusion

17/09/2009

The magnetic field is supposed to be  $|R_{max}|$  $z_{\rm max}$ - constant inside a cylinder of -Z<sub>max</sub>  $(\mathbf{x}_0, \mathbf{y}_0, \mathbf{z}_0)$  00000000 length 2 ×  $z_{max}$  and of radius  $R_{max}$ .

To make the code faster, the time of flight needed to exit the cylinder is computed

• 
$$t_{max} = min(t_T, t_z)$$
  $\begin{cases} t_z such that |z(t_z)| = z_{max} \\ t_T such that R(t_T) = R_{max} \end{cases}$ 

 $Bx \neq 0$   $By \neq 0$   $\implies$  iterative method, step by step until the particle exits the tracker region (slower method)

Limitation: magnetic field outside the tracker (e.g. in muon system) not simulated with **Delphes**.

#### **Calorimetric cells**

Segmentation in eta/phi

X. Rouby S. Ovyn

**Motivations** Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... **Tutorial** Conclusion

17/09/2009

Need to enter in the datacard the number of cells in pseudorapidity as well as the edges of the towers in eta/phi

#### Assumptions:

- the detector is supposed to be symmetric in  $\eta$ !
- all cells have an identical  $\phi$ -size for a given  $\eta$  value
- identical segmentation for ECAL and HCAL

e.g. **TOWER** number 40 TOWER\_eta\_edges 0. 0.087 0.174 0.261 0.348 0.435 0.522 0.609 0.696 0.783 0.870 0.957 1.044 1.131 1.218 1.305 1.392 1.479 1.566 1.653 1.740 1.830 1.930 2.043 2.172 2.322 2.500 2.650 2.868 2.950 3.125 3.300 3.475 3.650 3.825 4.000 4.175 4.350 4.525 4.700 5.000 10 10 10 10 10 10 10 10 10 10 10 10 10 20 20

- Charged and neutral final-state hadrons interact with the ECAL, HCAL and FCAL

X. Rouby S. Ovyn

**Motivations** Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... **Tutorial** 

Conclusion

17/09/2009

Smearing of particles performed using the expected fraction of the energy, determined according to their decay products, that would be deposited into the ECAL ( $E_{ECAL}$ ) and into the HCAL ( $E_{HCAL}$ )

- Summing energy of multiple impacts in identical towers

$$E_{ECAL}^{tower} = E_{ECAL}^{1} + E_{ECAL}^{2}$$
 and  $E_{HCAL}^{tower} = E_{HCAL}^{1} + E_{HCAL}^{2}$ 

Smearing of the corresponding energies

 $E^{tower} = E^{tower}_{SHCAL} + E^{tower}_{SECAL}$ 

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

High level objects, final reconstructed information

#### Lepton isolation:

- Isolation of charged particles using tracking information

No other charge particles with  $p_{\tau} > 2$  GeV/c within a cone

$$\Delta R = \sqrt{\Delta \eta^2 + \Delta \phi^2} < 0.5$$

- Additional information available for calorimetric isolation

## Delphes flow

#### Photons :

- identified with true PID
- reconstructed if they fall into the tracker coverage
- measured eta/phi from the corresponding calorimeter cell

#### Electrons and muons :

- identified with true PID
- reconstructed if they fall into the tracker coverage
- muons do not leave energy in the calorimeters

Limitation: no fakes, no punch-through, no clustering

#### 17/09/2009

jets

tau-jets-MET

Forward det.

Validation

BUT also...

Conclusion

**Tutorial** 

#### <u>Jets</u> :

- Treatement of particles which hadronise using jet reconstruction
- Uses reconstruction algorithms implemented in FastJet
  - CDF jet algorithm (cone)
  - CDF Midpoint algorithm
  - SIS Cone jets
  - Longitudinally invariant k, jets
  - Cambridge / Aachen jets
  - Anti k, jets
  - Jet algorithms differ
    - in their sensitivity to soft particles or collinear splittings
    - their computing speed performances.

FastJet: M. Cacciari, G.P. Salam, Phys. Lett. B 641 (2006) 57.

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det.

Validation

BUT also...

Tutorial

Conclusion

17/09/2009

Choice of the jet algorithm, jet parameters in the detector datacard

Delphes flow

In addition to the standard E, Px, Py, Pz, Eta, Phi variables, the jet collections also contains

- The number of tracks associated to the jet
- The hadronic and electromagnetic contents of the jet
- A b-flag indicating if the jet has been b-tagged

Assumptions for the *b*-tagging

- identical in the entire tracker coverage
- independent of the  $p_{_{\rm T}}$  of the jet
- efficiency controllable in the datacard (default= 40%)
- mis-identification of c (10%) and light jets (1%)

#### Final remark

The user can choose if a perfect energy recontruction is applied in the tracker coverage (perfect energy flow). If not, jets are taking as input the calorimetric cells.

X. Rouby

S. Ovyn

## Delphes flow

1) Requirement of tracking isolation

Selected from the jet collection

Tau-jets reconstruction:

Number of tracks associated to a particle with  $p_T > 2$  GeV/c is one and only one in a cone of radius  $R_{tracks}$ 

Tracking isolation

- 3-prong τ dropped.
- Cone should be entirely incorporated into the tracker

  - 17/09/2009

#### Delphes flow

- Measurement of Missing Transverse Energy (MET) in an *ideal detector* 
  - Momentum conservation imposes the transverse momentum of the observed final state ( $p_T^{obs}$ ) to be equal to the vector sum of the invisible particles,

$$ec{p}_{T} = \begin{pmatrix} p_{x} \\ p_{y} \end{pmatrix}$$
 and  $\begin{cases} p_{x}^{miss} = -p_{x}^{obs} \\ p_{y}^{miss} = -p_{y}^{obs} \end{cases}$ 

#### - MET reconstruction in **Delphes**

Missing Transverse Energy (MET) calculation based on the calorimetric towers:

$$\vec{E}_T^{miss} = -\sum_i^{towers} \vec{E}_T(i)$$

#### Limitations:

- dead channels, misalignment, noisy towers, cracks of the detector that worsen directly the MET not taken into account
- based on the calorimetric towers only
  - muons not used to reconstruct MET but can be added by hand

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

Very forward detector information

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also...

Tutorial

Conclusion

17/09/2009

Near-beam components

Most of recent experiments in HE physics have additional instrumentation along the beamline

- In addition to the central detector, **Delphes** includes
- Forward detectors to extend the eta coverage to higher values e.g. : Zero Degree Calorimeters
- (very) forward near-beam detectors

## HECTOR implementation

**Delphes** uses HECTOR to perform particle transport in beamlines

X. Rouby, J. de Favereau and K. Piotrzkowski, JINST 2(2007) P09005

Motivations Simulation BUT also... Tutorial Conclusion

#### Validation

## Validation: jet resolution

#### Validation procedures using CMS-like and ATLAS-like detectors

The jet resolution is therefore a crucial point

CMS resolution from: The CMS Collaboration, CERN/LHCC 2006-001. ATLAS resolution from: The ATLAS Collaboration, CERN-OPEN 2008-020.

The majority of interesting processes contain jets in the final state.

X. Rouby S. Ovyn

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

<u>Used samples</u>:  $pp \rightarrow ggX$ , following the methods of the corresponding reference

An excellent agreement is obtained comparing values of *Delphes* with the expectations of CMS and ATLAS detectors

## Validation: MET resolution

#### Validation procedures using CMS-like and ATLAS-like detectors

CMS resolution from: The CMS Collaboration, CERN/LHCC 2006-001. ATLAS resolution from: The ATLAS Collaboration, CERN-OPEN 2008-020.

HEP detectors designed to be as much hermetic as possible

X. Rouby S. Ovyn

Motivations Simulation Interface Tower-tracks photon-e/µ jets tau-jets-MET Forward det. Validation BUT also... Tutorial Conclusion

17/09/2009

#### • MET resolution is a crucial point

<u>Used samples</u>:  $pp \rightarrow gg$  : muon contribution is negligible

An excellent agreement is obtained comparing values of *Delphes* with the expectations of CMS and ATLAS detectors

Motivations Simulation BUT also... Tutorial Conclusion Additional features

Motivations Simulation BUT also... Trigger FROG Convertors Tutorial

Conclusion

## Trigger emulation

- Trigger selection in a <u>real experiment</u>

New physics often characterised by low  $\sigma$  of new physics compared to values of Standard Model ones

 $\rightarrow$  High statistics are required for data analyses  $\rightarrow$  high luminosity

BUT only a tiny fraction of the observed events can be stored for subsequent offline analyses,

- large data rejection factor using dedicated algorithms
  - Selection should be fast and very efficient

A trigger emulation is included in *Delphes*, using a fully parametrisable trigger table

Inclusive electron	>>	ELEC1_	PT:	'29'				
di-electron	>>	ELEC1_	PT:	'17'	& &	ELEC2_	PT:	'17'

- select events containing objects (i.e. jets, particles,met) with a  $\ensuremath{p_{_{\rm T}}}$  above some threshold.

- Logical combinations (AND) of several conditions are also possible.

- Default trigger tables available for ATLAS & CMS experiments 37

3D Event Display

FROG: L. Quertenmont, V. Roberfroid, arXiv:0901.2718v1[hep-ex]

Visualisation is useful to convey information about the detector layout and the event topology in a simple way.

The Fast and Realistic OpenGL Displayer FROG interfaced in **Delphes** 

X. Rouby S. Ovyn

Motivations Simulation BUT also... Trigger FROG Convertors Tutorial

Conclusion

#### <u>Reminder</u>

- Detector assumed to be strictly symmetric around the beam axis.

- Only the geometrical coverage: towers are not drawed

Utility of the detector visualisation

- Communication purpose

- Geometric coverage of the different detector subsystems clearly visible.

## 3D Event Display

FROG: L. Quertenmont, V. Roberfroid, arXiv:0901.2718v1[hep-ex]

Visualisation is useful to convey information about the detector layout and the event topology in a simple way.

The Fast and Realistic OpenGL Displayer FROG interfaced in Delphes

#### Utility of the event visualisation

- Deeper understanding of interesting physics processes

phes

## Additional features

Forgotten to run the trigger selection, the LHCO output or the preparation for the event visualitsation?

Stand-alone running programs are available

Tutorial Conclusion

17/09/2009

## Additional features

Simulation

Trigger

**FROG** 

**Tutorial** 

Motivations Simulation BUT also... Tutorial Conclusion

## Summary and Outlook

We present here a new framework for the fast simulation of a generic collider experiment

- Includes Trigger, forward near-beam detectors, 3D Event display
- Several input file types accepted by **Delphes** 
  - StdHEP
  - ROOT files
  - Les Houches Event Format
  - НерМС
- **Delphes** stores output information in
  - ASCII file of LHCO type
  - ROOT format
- **Delphes** performs a *fast* simulation:

- 1 000 events, 10.96 s (regular laptop), 240 MB (physics dependent)

Can be used for fast evaluation of observability of new signals in phenomenology, as an illustration tool for tutorial sessions, ...

Motivations Simulation BUT also... Tutorial Conclusion Small tutorial...

## Getting started : download

Delphes	Code download from the website : « <i>download »</i> link Delphes tar-ball is self-sufficient, it contains every
V Douby	dependencies needed for the physics.
S. Ovyn	or from a command line :
Motivations	wget http://www.fynu.ucl.ac.be/users/s.ovyn/Delphes/files/Delphes_V_1.8.tar.gz
Simulation	
BUT also	
Tutorial	Requirements
Conclusion	
	A recent working ROOT version (http://root.cern.ch)

ROOT: R. Brun, F. Rademakers, NIM A 389 (1997) 81-86.

**Delphes** has been developped on ROOT > 5.18 on Linux with GNU gcc/g++ > 4.1.2, but any recent version should be fine.

## Getting started : download

#### Requirements

root

#### **Checking ROOT installation**

#### echo \$ROOTSYS

X. Rouby S. Ovyn

phes

Motivations Simulation BUT also... Tutorial If empty, check that the environment variables are defined. In *bash* shell, check that these variables are in the .bashrc: (e.g. assuming ROOT is in /usr/bin/root export ROOTSYS=/usr/bin/root export PATH=\$PATH:\$ROOTSYS/bin export LD\_LIBRARY\_PATH=\$LD\_LIBRARY\_PATH:\$ROOTSYS/lib Test it :

If the FROG event display is to be run:

**3D-OpenGL** libraries are not included in the tar.gz, but required only if FROG is used. These libraries can be downloaded from here: http://curl.haxx.se/download.html More on FROG requirements: http://projects.hepforge.org/frog/index.php?page=Starting.php

## Getting started : compile

X. Rouby S. Ovyn

Motivations Simulation BUT also... Tutorial Conclusion

#### Untar – decompress the code sources

tar -xzf Delphes\_V\_1.8.tar.gz

#### Compile the sources

cd Delphes\_V\_1.8
./genMakefile.tcl > Makefile
make
>> Compiling tmp/Utilities/ExRootAnalysis/src/BlockClassesDict.cc
>> Compiling tmp/src/TreeClassesDict.cc
...
>> Building Analysis\_Ex
Delphes has been compiled

Ready to run

Many lines are printed during the compilation.

In particular, the dependencies (like FastJet, mcfio, stdhep) lead to a few warning messages. This is normal and harmless.

# Delphes

## Getting started : samples

#### Input files from MC generator

Suggested samples for this introduction:

X. Rouby S. Ovyn

Motivations Simulation BUT also... Tutorial Conclusion wget http://www.fynu.ucl.ac.be/users/s.ovyn/Delphes/files/tt\_jj\_small.hep.tar.gz tar -xzf tt\_jj\_small.hep.tar.gz mv samples/\* .

These events are  $\gamma p \rightarrow tt X$ ,

generated with MadGraph/MadEvent and

```
hadronised with Pythia
```

saved into StdHEP file format (\*hep).

List of input files:

text file containing one input data file per line all data files must be of the same type

# Delphes

## Backup slides

## Magnetic Field

Expression of the position and momentum of the charged particle at any time t.

$$r = \frac{p_{T0}}{\omega y m} \qquad \omega = \frac{q}{y m} B_{z} \quad \phi_{0} = -\arctan(\frac{p_{x0}}{p_{y0}}) \\ B_{z} = 0 \qquad (x_{t}, y_{t}) \\ B_{z} \neq 0 \qquad (x_{t}, y_{t}) \\ R_{z} = 0 \qquad (x_{t}, y_{t$$

## Magnetic Field

To make the code faster, the time of flight needed to exit the cylinder is computed

 $1^{\circ}$ ) t<sub>z</sub>: time needed to reach the end of the tracker longitudinally

$$t_{z} = \frac{\gamma m}{p_{z0}} (-z_{0} + z_{max} \times sign(p_{z0}))$$

X. Rouby S. Ovyn

2°)  $t_z$ : time to exit the volume by the side once  $R(t) = R_{max}$   $t_T = \frac{1}{\omega} [\Phi_c - \phi_0 + \arctan(\frac{R_{max}^2 - (R_c^2 + r^2)}{2rR_c})]$   $\downarrow$  $t_{max} = min(t_T, t_z)$   $\begin{cases} t_z such that |z(t_z)| = z_{max} \\ t_T such that R(t_T) = R_{max} \end{cases}$ 

<u>Bx  $\neq$  By  $\neq$  0</u> iterative method step by step until the particle exits the tracker region Method slower than for a pure solenoidal B field

Disclamer: magnetic field of muon chambers such as for ATLAS not simulated with **Delphes** 

#### <u>Cone algorithms</u>

1°) CDF jet algorithm - cone (also named « JetClu cone jet algorithm »)

Jets algorithms

- Associates together towers lying within a circle in the ( $\eta$ ,  $\phi$ ) space.
- Used by the CDF experiment in Run II.
- Towers with a  $E_{T}$  higher than a given threshold (default:  $E_{T} > 1$  GeV) used as seeds for the jet candidates.

The existing FastJet code has been modified to allow easy modification of the tower pattern in  $\eta$ ,  $\phi$  space.

JetClu is not infrared safe

With addition of a soft gluon

Identified as 1 jets

More performant algorithms are also available in Delphes

#### <u>Cone algorithms</u>

1°) CDF jet algorithm - cone (also named « Jetclu cone jet algorithm »)

Jets algorithms

- Associates together towers lying within a circle in the ( $\eta$ ,  $\phi$ ) space.
- Used by the CDF experiment in Run II.
- Towers with a  $E_{T}$  higher than a given threshold (default:  $E_{T} > 1 \text{ GeV}$ ) used as seeds for the jet candidates.

The existing FastJet code has been modified to allow easy modification of the tower pattern in  $\eta$ ,  $\phi$  space.

#### 2°) CDF Midpoint algorithm

- Identical jet procedure than the CDF jet cone algorithm
- Algorithm that reduces infrared sensitivity
- Adds 'midpoints' (energy barycentres) in the list of cone seeds.

#### 3°) SIS Cone jets : NO seed!

- Simultaneously insensitive to additional soft particles and collinear splittings,
- Fast enough to be used in experimental analysis.

## Jets algorithms

**Recombination algorithms** 

- Infrared and colinear safe
- Merge successive calorimeter tower pairs
- Similar jet running except for the definition of distances d

X. Rouby S. Ovyn distance  $d_{ij}$  between each pair of towers (i, j) variable  $d_{iB}$  (beam distance) depending on the  $p_{T}$  of the tower i.

#### <u>Algorithm:</u>

- Browses the calotower list
- Starts by finding the minimum value  $d_{min}$  of all  $d_{ij}$  and  $d_{iB}$ .
- $d_{min} = d_{ij}$  towers i and j merged into a single tower with  $p^{\mu} = p^{\mu}(i) + p^{\mu}(j)$ -  $d_{min} = d_{iB}$  the tower is declared as a final jet

**4°)** 
$$k_{t}^{i}$$
 jets:  $d_{ij} = min(k_{ti}^{2}, k_{tj}^{2}) \Delta R_{ij}^{2} / R^{2}$  and  $d_{iB} = k_{ti}^{2}$ 

5°) Cambridge / Aachen jets:  $d_{ij} = \Delta R_{ij}^2 / R^2$  and  $d_{iB} = 1$ 

6°) Anti  $k_{t}$  jets:  $d_{ij} = min(1/k_{ti}^2, 1/k_{tj}^2) \Delta R_{ij}^2/R^2$  and  $d_{iB} = 1/k_{ti}^2$

## Validation: jet resolution

Validation procedures using CMS-like detector parameters

CMS resolution from: The CMS Collaboration, CERN/LHCC 2006-001.

The majority of interesting processes contain jets in the final state.

The jet resolution is therefore a crucial point

<u>Sample used</u>: pp→gg

- Arranged in 14 bins of gluon  $\boldsymbol{p}_{_{T}}$  .
- In each  $\textbf{p}_{\tau}$  bin, Delphes jets are matched to the closest GEN jet using

 $\Delta R = \sqrt{(\eta^{rec} - \eta^{MC})^2 + (\phi^{rec} - \phi^{MC})^2} < 0.25$ 

-  $E_{\tau}^{rec}/E_{\tau}^{MC}$  histograms fitted with a Gaussian distribution in the interval ±2 rms centred around the mean value. The resolution in each  $p_{\tau}$  bin is obtained by

An excellent agreement is obtained comparing values of *Delphes* with the expectations of the general purpose CMS detector
