# FeynRules

## A Mathematica package to calculate Feynman rules

FeynRules is a Mathematica® package that allows the calculation of Feynman rules in momentum space for *any* QFT physics model. The user needs to provide FeynRules with the minimal information required to describe the new model, contained in the so-called model-file. This information is then used to calculate the set of Feynman rules associated with the Lagrangian. The Feynman rules calculated by the code can then be used to implement the new physics model into other existing tools, such as MC generators. This is done via a set of interfaces which are developed together and maintained by the corresponding MC authors.

## Implementation Author

- Neil Christensen
  - Michigan State University
  - [neil@pa.msu.edu](mailto:neil@pa.msu.edu)

This implementation is based on an earlier implementation done in collaboration with Alexander Belyaev which can be found [here](#).

## References

- [Phys.Rev.D74:075011,2006](#): This is the first description of the 3-Site Model.
- [Phys.Rev.D78:031701,2008](#) : This is a study of the LHC collider phenomenology of the 3-Site Model that uses the earlier LanHEP version that this implementation was based on.
- [arXiv:0906.2472](#) : This is the 2nd [FeynRules](#) paper where this implementation was published. It contains a shortened version of the notes below.

## Model Files

- [3-Site-v1.3.tgz](#): 3-Site Model model-files.

## Model Implementation

## Interfaces

This model implementation is known to work with the following interfaces:

- [CalcHEP/CompHEP Interface](#)
- [MadGraph Interface](#)
- [Sherpa Interface](#): This model works with a beta version of Sherpa that will be released later this year.
- [FeynArts Interface](#): A handful of calculations have been done but a thorough validation has not been done.

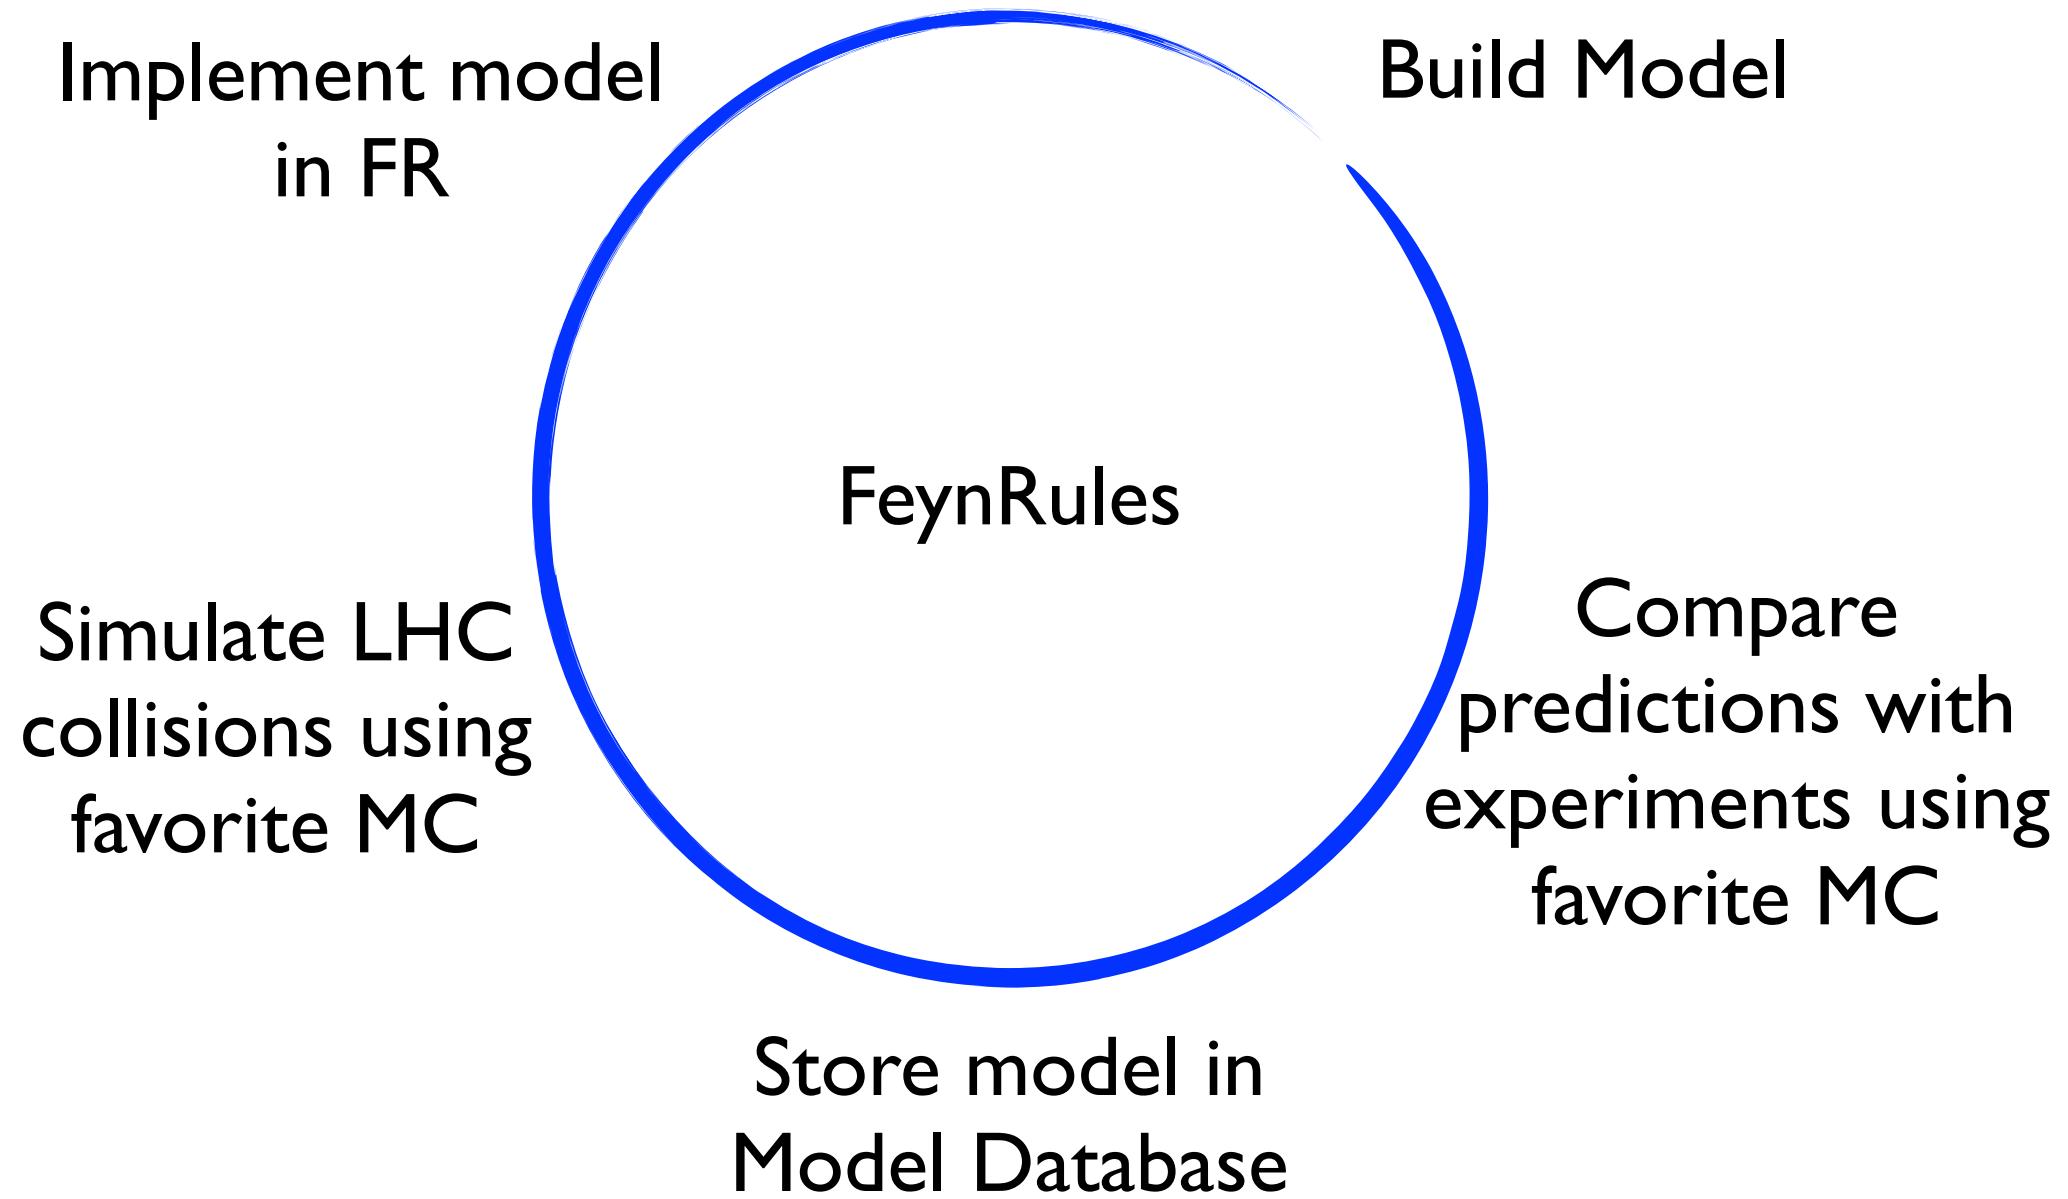

## Also Whizard!

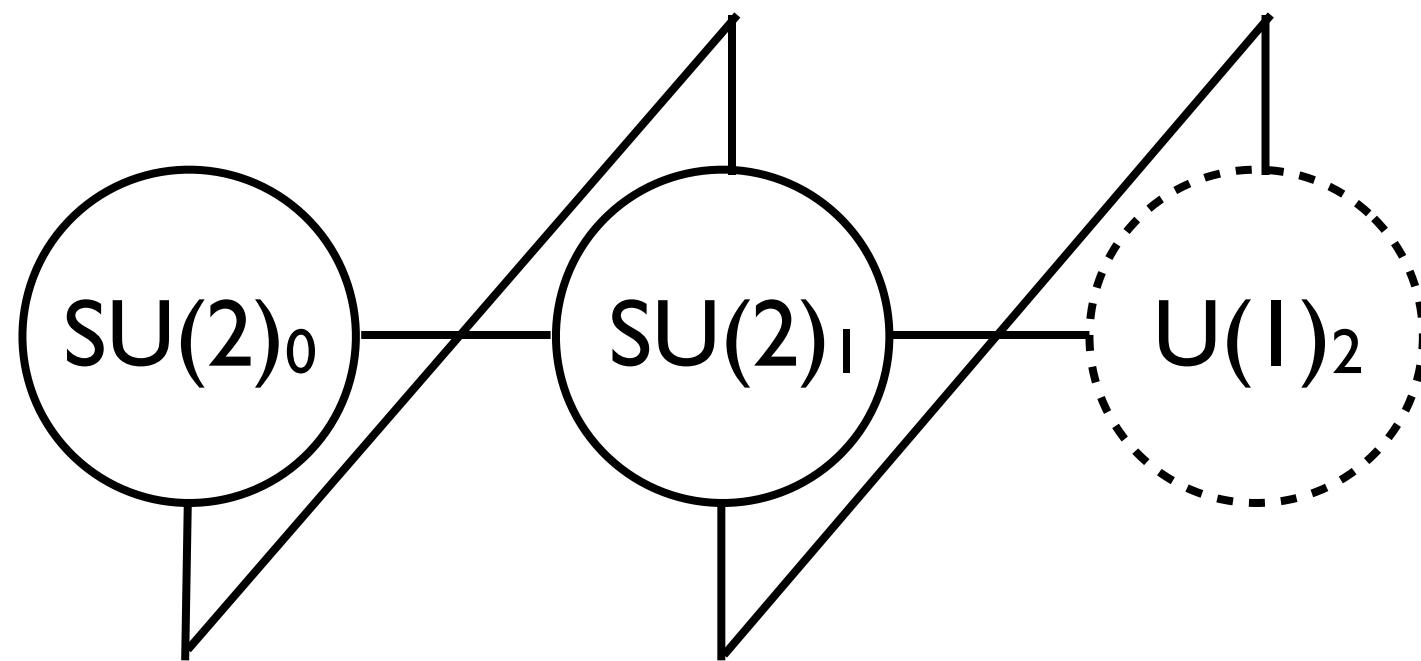

## Validation

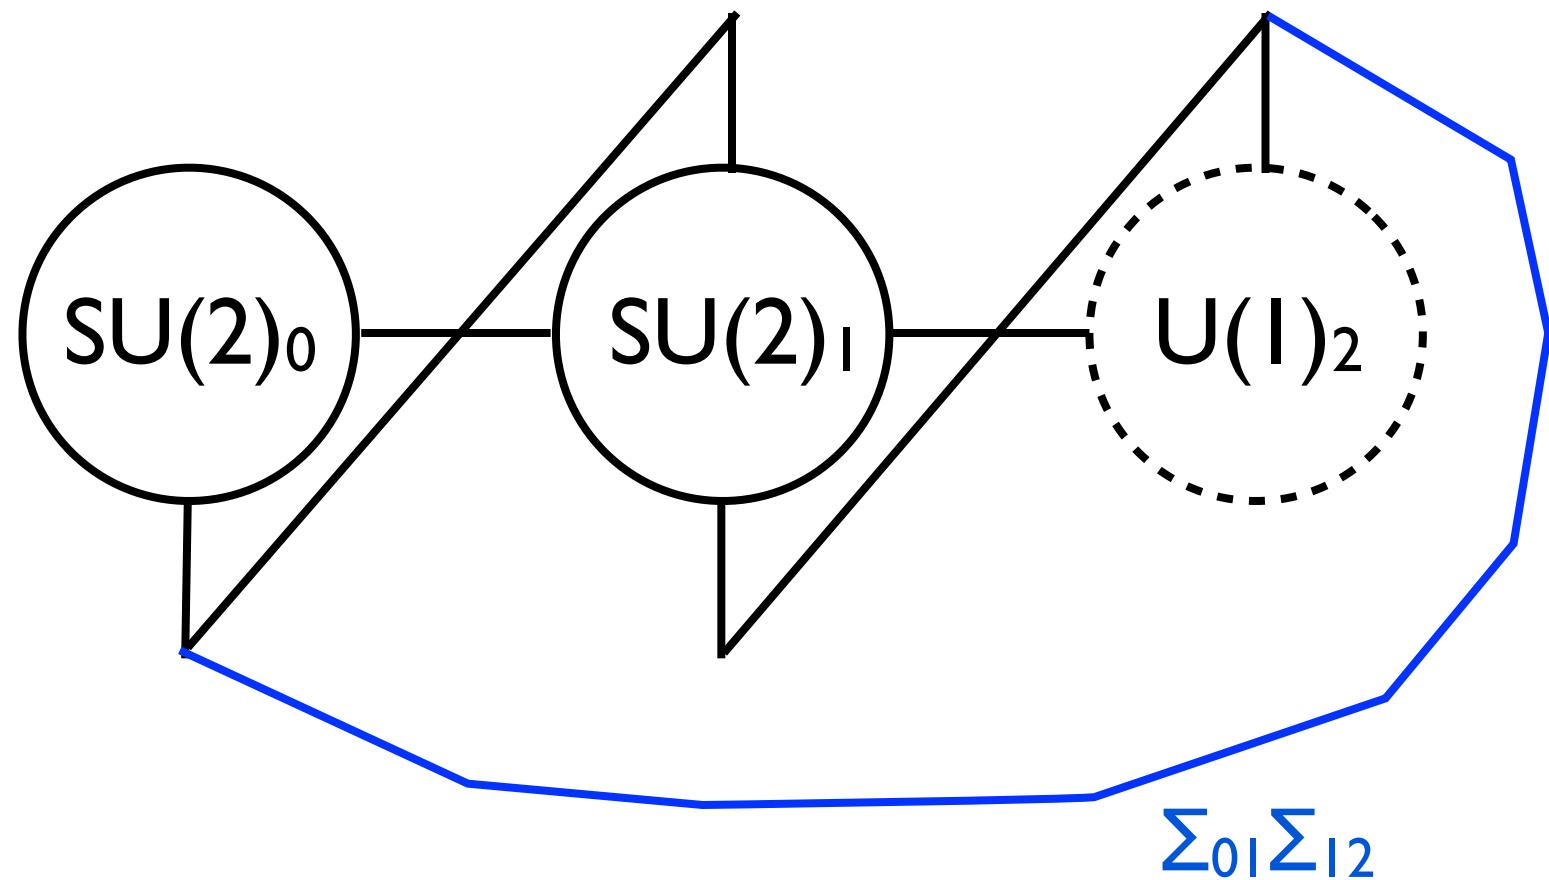

Over 200 2→2 processes were run in a variety of ways. First, each process was compared between the original LanHEP implementation and the current [FeynRules](#) implementation. Second, each process was run across multiple monte-carlos including CalcHEP, CompHEP, MadGraph and Sherpa. Third, each process was run in two different gauges, namely Feynman gauge (in CalcHEP and CompHEP) and in unitary gauge (in CalcHEP, MadGraph and Sherpa). The cross section was computed for each process and compared to one another. Agreement to better than 1% was found for all processes. The parameters for these calculations were taken as in the model files above. The energies and cuts for these calculations were:

**Implement MHM  
in FeynRules**

# Build MHM: Minimal Higgsless Model

Implement MHM  
in FeynRules

Simulate MHM  
at the LHC

# Build MHM: Minimal Higgsless Model

Implement MHM  
in FeynRules

Simulate MHM  
at the LHC

Store MHM in  
Model Database

## Build MHM: Minimal Higgsless Model

Implement MHM  
in FeynRules

Simulate MHM  
at the LHC

Store MHM in  
Model Database

Compare predictions  
with LHC data:  
Still to be done!

## Build MHM: Minimal Higgsless Model

Implement MHM  
in FeynRules

Extend MHM  
to fit data

Simulate MHM  
at the LHC

Store MHM in  
Model Database

Compare predictions  
with LHC data:  
Still to be done!
